MEDLINE=9938931; Pubmed=9723928;
Chung Y.S., Breidt F., Dubnau D.A.;
Clang Y.S., Breidt F., Dubnau D.A.;
"Cell surface localization and processing of the ComG proteins, required for DNA binding during transformation of Bacillus subtilis.";
mol. Microbiol. 29:905-913(1998).
-!- FUNCTION: REQUIRED FOR TRANSFORMATION AND DNA-BINDING.
-!- SUBCELLULAR LOCATION: THE UNPROCESSED FORM IS AN INTEGRAL MEMBRANE PROTEIN WITH ITS C-TERMINUS OUTSIDE THE MEMBRANE. UPON CLEAVAGE,
IT IS TRANSLOCATED TO THE OUTER FACE OF THE MEMBRANE.
-!- PTM: PROCESSING OF COMGC IN COMPETENT CELLS REQUIRES COMC.

-!- FUNCTION: THIS ENZYME IS INVOLVED IN NUCLEOTIDE METABOLISM: IT PRODUCES DUMP, THE IMMEDIATE PRECURSOR OF THYMIDINE NUCLEOTIDES AND IT DECREASES THE INTRACELLULAR CONCENTRATION OF DUTP SO THAT URACIL CANNOT BE INCORPORATED INTO DNA (BY SIMILARITY).

-!- CATALYTICA CATIVITY: DOTP + H(2)0 - DUMP + PYROPHOSPHATE.

-!- PATHWAX: DE NOVO SYNHESIS OF THYMIDYLATE.

-!- SIMILARITY: BELONGS TO THE DUTPASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-NoV-1995 (Rel. 32, Created)

WALCHING."

WELL BLAYNOL. 194:132-146(1991)

I PUNCTION: INITIATION OF MATING TYPE INTERCONVERSION. THIS PROTEIN

IS A SITE-SPECIFIC ENDONUCLEASE THAT CLEAVES A SITE IN THE MAT

LOCUS ON CHROMOSOME III. THE DOUBLE-STRAND BREAK IS FOLLOWED BY A

UNIDIRECTIONAL GENE CONVERSION EVENT THAT REPLACES THE INFORMATION

AT THE MAT LOCUS BY INFORMATION COPIED FROM ETHER OF THE TWO

HONOLOGOUS LOCI (HMR AND HML) THAT RESIDE AT THE EXTREMITY OF THE

CHROMOSOME III. ENDONUCLEASE EXPRESSION TAKES PLACE IN LATE GI

JUST BEFORE CELLS ENTER S PHASE.

I- MISCELLAREOUS: THE METAL-BINDING DOMAIN FORM ZINC-FINGERS THAT ARE

INVOLVED IN BINDING OF THE DNA

Submitted (APR-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: AMINOPEPTIDASE WITH BROAD SUBSTRATE SPECIFICITY TO
SEVERAL PEPTIDES. IT HAS MORE AFFINITY FOR OLIGOPEPTIDES THAN FOR
DIPEPTIDES. IT PLAYS AN ESSENTIAL ROLE IN THE METABOLISM, IT MAY
BE INVOLVED IN NITROGEN SUPPLY OR PROTEIN TURNOVER.
-!- COFACTOR: BINDS ONE ZINC ION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AN UNKNOWN MECHANISM.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M1 (ZINC METALLOPROTEASE);
ALSO KNOWN AS THE PEPN SUBFAMILY.
                Aminoacyl-tRNA synthetase; Protein biosynthesis; Ligase; ATP-binding;
                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                             Lactococcus lactis (subsp. lactis) (Streptococcus lactis).

                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                            Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- POLYMORPHISM: N-ACETYLATION POLYMORPHISM IS DETERMINED BY A LOW OR HIGH NAT ACTIVITY IN LIVER, IT HAS BEEN IMPLICATED IN THE ACTION AND TOXICITY OF AMINE-CONTAINING DRUGS. SLOW ACETYLATION GENOTYPES HAVE BEEN ASSOCIATED WITH SIGHIFICANT LUNG CANCER RISK. CANDIDATE RISK PACTOR FOR SUSCEPTIBILITY TO NEURAL TUBE DEFECTS. THE NATI+10 ALLELE HAS BEEN ASSOCIATED WITH INCREASED RISK OF COLON AND URINARY BLADDER CANCERS AND WITH HIGHER LEVELS OF N-ACETYLTRANSFERASE ACTIVITY AND DNA ADDUCTS IN AROWATIC AMINE TUMOR TARGET ORGANS SUCH AS COLON AND URINARY BLADDER.
-- MISCELLANGOUS: NATH WAS HISTORICALLY CONSIDERED TO BE MONOMORPHIC IN NATURE BUT REPORTS OF ALLELIC VARIATIONS AT THE NATI LOCUS SUGGEST THAT IT IS A POLYMORPHICALLY EXPRESSED ENZYME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FINAL MAGGERICS 8:269-281(1998).
-1- FUNCTION: PARTICIPATES IN THE DETOXIFICATION OF A PLETHORA OF HYDRAZINE AND AFFLAMINE DRUGS. CATALYZES THE N- OR O-ACETYLATION OF VARIOUS ARYLAMINE AND HETEROCYCLIC AMINE SUBSTRATES AND IS ABLE TO BIOACTIVATE SEVERAL KNOWN CARCINOGENS.
-1- CATALYTIC ACTIVITY: ACETYL-COA + ARYLAMINE = COA +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lin H.J., Probst-Hensch N.M., Hughes N.C., Sakamoto G.T., Louie A.D., Kau I.H., Lin B.K., Lee D.B., Lin J., Frankl H.D., Lee E.R., Hardy S., Grant D.M., Haile R.W.;
"Variants of N-acetyltransferase NAT1 and a case-control study of
"Study of the role of the highly conserved residues Arg9 and Arg64 in the catalytic function of human N-acetyltransferases NAT1 and NAT2 by site-directed mutagenesis.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SIMILARITY: BELONGS TO THE ARYLAMINE N-ACETYLTRANSFERASE FAMILY.
-!- CAUTION: THE ALLELIC VARIATION ILE-149 DESIGNATED AS NAT1*17 IS
PART OF THE NAT1*11 ALLELIC VARIATION AS REPORTED BY THE
NOMENCLATURE COMMITEE.

"Cloned mouse N-acetyltransferases: enzymatic properties of expressed Nat-1 and Nat-2 gene products.";
Mol. Pharmacol. 42:265-272(1992).
-!- FUNCTION: PARTICIPATES IN THE DETOXIFICATION OF A PLETHORA OF HYDRAZINE AND ARYEMENED SUGGRAFES FOR NAT-2. LESS ACTIVITY WITH ANISIDINE AND BARELY DETECRABLE WITH SM2.
-!- CAPALYTIC ACTIVITY: ACETYL-COA + ARYLAMINE = COA +
                                                                                                                                                                                                                                                      N-ACETYLARYLAMINE.
-- SUBCELLULAR LOCATION: CYTOPLASMIC.
-- POLYMORPHISM: THERE ARE TWO FORMS OF NAT2: A RAPID/STABLE ISOFORM (ASN-99) AND A SLOW/UNSTABLE ISOFORM (ILE-99).
-- SIMILARITY: BELONGS TO THE ARYLAMINE N-ACETYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-JUL-1989 (Rel. 11, Last sequence update)

STRAIN-SPRAGUE-DAWLEY; TISSUE-Liver;
JONES R.F., Gott B., Land S.J., Park J., King C.M.;
JONES R.F., Gott B., Land S.J., Park J., King C.M.;
Submitted (XXX-1993) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: PARTICIPATES IN THE DETOXIFICATION OF A PLETHORA OF
HYDRAZINE AND ARYLAMINE DRUGS. ACETYLATES ONLY ARYLAMINES.

-I- CATALYTIC ACTIVITY: ACETYL—COA + ARYLAMINE = COA +
N-ACETYLARIAMINE
-I- SUBCELLULAR LOCATION: CYTOPLASMIC.

-I- SUBCELLULAR LOCATION: CYTOPLASMIC.

-I- POLXMORPHISM: THERE ARE TWO FORMS OF NAT2: A RAPID ISOFORM
(NAT2*21A) AND A SLOW ISOFORM (NAT2*21B).

-I- SIMILARITY: BELONGS TO THE ARYLAMINE N-ACETYLTRANSFERASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 12

T48401

histone deacetylase-like protein - Arabidopsis thaliana

histonate names: protein F17C15.160

C. Species: Arabidopsis thaliana (mouse-ear cress)

C. Date: 20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 20-Apr-2000

C. Accession: T48401

R. Bevan, M.; Pohl, T.; Weizenegger, T.; Bancroft, I.; Mewes, H.W.; Rudd, S.; Lemcke, I submitted to the Protein Sequence Database, March 2000

A; Reference number: 224492

A; Accession: T48401

A; Retains: preliminary

A; Molecule type: DNA

A; Residues: 1-296 ABV>

A; Residues: 1-296 ABV>

A; Consorreferences: EMBL:Al162506
